A-514 Self-Centering Bore Adapters for the A-512 Target

The A-514 self-centering laser and bore adapters accurately and quickly position the laser and target on the bore centerline. The adapters have adjustable legs that allow them to be used for bore diameters ranging from 3.75" (95 mm) to 40" (1M).

Three sizes are available, as follows:
- **A-514A** for bores from 3.75" (95 mm) to 6.75" (172 mm)
- **A-514B** for bores from 6.5" (165 mm) to 17.5" (445 mm)
- **A-514C** for bores from 17.0" (432 mm) to 40.0" (1 M)

How the A-512 Target and A-514 Adapters Work

The A-512 Target is designed so that the PSD is centered axially between the 4 feet of the A-514 Adapter, 2 of which are offset axially from the other 2. This, in effect, puts the PSD on the pivot point of the adapter and allows the angle of incidence to the laser beam to vary by up to 45º. This means even if the bore diameter changes, the A-514 will still self-center giving an accurate measurement of the bore's alignment. To insert the target into the bore, attach the handle to the target and tip the target forward, which allows it to easily slide into the bore. Release the handle/insertion pole and the target/adapter "jam" into the bore, finding the center automatically. The weight of the handle keeps the target centered in the bore.

How the A-512/A-514 Self-Centering Bore Adapters Work
How the Alignment System Works – Line Boring Machinery

Post Machining QC Procedure

Step 1 Measure Bearing ID and Install Laser & Target into Spherical Bearings

1. Remove the boring bar and install the L-706 Laser into one of the end bearings. If needed use an L-706-SC Self-Centering Fixture if the bearing is bigger than 2.250 in.

   a. Measure the nominal bore ID. Use the A-514G Leg-Setting Gage to set the legs of the A-514 Bore Adapter to the nominal bore ID.

   b. Attach the A-514 Bore Adapter on the A-514GS gage. Insert a measuring leg and adjust it until they touch the setting plate. Tighten the set screw to hold the leg in place and repeat for other legs.

   c. Insert the A-512 Target into the A-514 Adapter and insert them into the far spherical bearing bore, making sure the adapter's level vial is level. Connect the A-512 Target to the R-1307 Readout.
2. Turn on the laser and connect the R-1307 Readout.

3. Adjust the L-706 micrometers to tilt the laser until it reads zero. The L-706 is now ready to take measurements of the bore alignment of the newly machined bores.
Measure the ID of the newly machined bores. Set the A-514 Adapter legs to the correct ID, insert the A-512 Target and connect the R-1307 Readout.

4. Move the A-512/A-514 into the other bores to measure for straightness. Record the data in Bore9 software, which analyzes the data, removes any buckin (laser setup) errors, and provides the best bore straightness results.
   a. Each measurement takes about 10 seconds.
